RESULT 75

US-10-289-762-189

US-10-289-762-189

Sequence 189, Application US/10289762

Publication No. US20040006218A1

GENERAL INFORMATION:

APPLICANT: GETIffais,

TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments

TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve

TITLE OF INVENTION: and treatment of infection

TITLE REFERENCE: 97.003-999

CURRENT APPLICATION NUMBER: US/10/289,762

NUMBER OF SEQ ID NOS: 6849

SEQ ID NOS: 6849
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

It is belived to be a member of the tumour necrosis factor cytokine family. Its amino acid sequence was deduced from a cDNA clone (AAT72796) isolated from a human placental cDNA library. Apo-2 ligand polypeptides, esp. those corresponding to amino acids 114-281, 15-281 or 1-281 of Apo-2 ligand, can be produced by culturing cells transformed or transfected with a vector contg. Apo-2 ligand nucleic acid. They can be used to induce apoptosis in mammals and to treat pathological conditions such as cancer (esp. breast or colon cancer) or to raise antibodies useful in diagnostic assays

AIM-I is a member of the tumour necrosis factor (TWF) ligand superfamily. The products can be used in the diagnosis and treatment of disorders related to under-expression, over-expression or altered expression of AIM-I AIM-I or agonists can be used for treating autoimmune disorders including systemic lupus erythematosus, immunoproliferative disease lymphadenopathy (IPL), rheumatoid arthritis, angioimmunoproliferative lymphadenopathy (AIL), rheumatoid arthritis, diabetes, and multiple sclerosis, graft versus host disease, to inhibit neoplasia such as tumour cell growth, to treat restenosis, to regulate haematopoiesis in endothelial cell development, to stimulate peripheral

                                                                                                                                                                                                                         Human tumour necrosis factor related apoptosis inducing ligand (TRAIL) (AAW19787) is a novel cytckine that induces apoptosis of certain target cells, including cancer cells and virally infected cells. Its amino acid sequence was deduced from cDNA clone HuAIC (AAT72848), deposited in vector pDC409 as ATCC 69849. Recombinant TRAIL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used in the treatment of cancer (e.g. leukaemia, lymphoma and melanoma) and viral infections, or to raise antibodies that may be useful for treating thrombotic

This protein is used in a method resulting in the isolation of the novel human TNR related receptor. TR6 TR6 polypeptides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimnume diseases (e.g. inflammatory bowel disease, isolated), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenoisis, brain injury, (acquired autoimnume disease syndrome) hubs, bone diseases, cancer (e.g. lympho-proliferative disorders), atherosclerosis and Alzheimers disease

This represents a human tumour necrosis factor related apoptosis ligand (TRAIL) polypeptide. The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful for producing the recombinant TRAIL polypeptides, which may be useful in studies of apoptosis, to purify leukaemia, lymphoma or melanoma cells feg. to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marrow), or to treat viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 DDSYWDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120

The present sequence represents human AGP-1. AGP-1 is a tumour-necrosis factor (TNP)-related protein, involved in inflammation, myelopoiesis and bone resorption. It has the same nucleic acid and antho acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAIL) described in Immunity, 3 (1995) 673. Antibodies (Ab) are used as immunoassay reagents for detecting AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid arthritis, systemic lupus cused to treat inflammation (e.g. rheumatoid arthritis, systemic lupus erythematosus, psoriasis, scleroderma, infection-related inflammation) or bone resorption diseases (e.g. osteoporoais, osteomyalitis, hypercalcaemia, Paget's disease). AGP-1 can be used to treat hypercalcaemia, paget's disease). AGP-1 can be used to treat marrow cells, particularly neutrophils and lymphocytes, e.g. where caused marrow cells, particularly neutrophils and lymphocytes, e.g. where caused transformed with expression vectors containing AGP-1 DNA, are used to produce recombinant AGP-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

```
The specification describes the use a polypeptide corresponding to at disast the primary sequence of part of the present sequence to produce a diagnostic, prophylactic or therapeutic composition useful in cases of degenerative, autoimmune and inflammatory diseases. The polypeptides can be used in treatment of neurodegenerative disease, lupus erythematosus, nhuematoid arthritis, and SEP. The polypeptides are apoptotic in central nervous system cells, antigenic and specifically recognise the surface receptor of the TRAIL protein. The polypeptide is a marker of disease and anti-TRAIL antibody or a TRAIL equivalent that binds to specific alth an receptors, inhibiting formation of natural complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   121 RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a novel human cytokine, designated Apo-2 ligand (Apo-2L). The Apo-2L polypeptide can be produced by standard recombinant methodology. Apo-2L is useful for inducing apoptosis in mammalian cancer cells. This is useful for the treatment of cancer. Apo-2L can be used to induce apoptosis for pathological conditions characterized by decreased levels of apoptosis, e.g. autoimmune disorders like lupus and immunemediated glomerular neghritis and cancer. Apo-2L and its nucleic acid coding sequence can also be used in quantitative and screening diagnostic techniques. Anti-Apo-2L antibodies can be used for treating diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180

This sequence is the human Apo-2 ligand protein, which is recognised by monoclonal antibodies produced by the hybridoma cell lines of the invention. The hybridoma cell lines are deposited under the American Type Culture Collection Accession Numbers ATCC HB-1225, HB-1225, and HB-12259. The Apo-2 ligand antibodies may be used in diagnostic assays for Apo-2 ligand, e.g. detecting its expression in specific cells, tissues, or serum. The antibodies may also be employed as therapeutics. For instance, anti-Apo-2 ligand antibodies which holock Apo-2 ligand activity, like Apo-2 ligand antibodies which holock Apo-2 ligand activity, like Apo-2 ligand-induced apoptosis, may be employed to treat pathological conditions or diseases associated with increased apoptosis. They are also useful for the affinity purification of Apo-2 ligand from recombinant cell culture or natural sources. The Apo-2 ligand itself may be used to treat diseases e.g. cancer, by inducing apoptosis in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated monoclonal antibodies having antigen specificity for Apo-2 ligand, e.g. 2G6, 2E11 or 5C2, useful for detecting the expression of Apo-2 ligand serum, and for treating diseases associated with increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

The present invention describes an antibody that binds to a human protein (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO3434; PRO4075; PRO3657; PRO1295; PRO1293; PRO1263; PRO4344; PRO4354; PRO4075; PRO1555; PRO1096; PRO2038; and PRO2262. (I) has anticancer activity and can be used to diagnose tumours in mammals, by detecting complex formation when the antibody is contacted with test cells. Increased expression of genes encoding (I) can also be detected to diagnose tumours. Agents which inhibit the activity of (I), especially the antibodies, or an antisense oligonucleotide which hybridises to genes encoding (I), can be used to inhibit tumour growth, preferably by inducing cell death. Methods from the present invention can be used to identify compounds which inhibit the biological activity of (I). AAC58019 to AAC58102 represent PCR primers and hybridisation probes used in examples from the present invention for human PRO sequences. AAC58103 to AAC5812 and AAB24031 to AAB24040 represent human PRO sequences. AAC58103 to protein sequences given in the exemplification of the present invention
Antibodies specific for PRO polypeptides, used to diagnose and inhibit the growth of tumors in mammals, and to identify inhibitors of PRO
                                                                                                                                                                                                                                                                                                                    Human, tumour, diagnosis, neoplastic disease, proliferation, cancer, identification, tumourigenesis, anticancer, detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gurney AL, Roy MA, Watanabe CK,

The present sequence represents a human TRAIL (tumour necrosis factor (TNF) related apoptosis-inducing ligand) polypeptide. The specification describes a method for enhanced killing of tumour cells. The method comprises contacting a susceptible tumour cell with a synergistic mixture of a TRAIL receptor ligand and a diterpencid triepoxide in a combined dosage to kill at least 50 % of the cells. This mixture is synergistic, and so is active at lower doses and against otherwise resistant cell lines. The method is used for killing tumour cells, especially solid tumours or carcinomas (especially mammary carcinoma or non-small cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is human AGP-1, a type II transmembrane protein. Fusion proteins comprising an FC immunoglobulin region fused to the Netarninal portion of the AGP-1 protein have been produced. The fusion proteins can be used to induce apoptosis in a tissue, and to treat proliferative disorders, immune disorders, or virally-induced disorders. The proliferative disorders include cancers, such as breast, prostate, lung or colon cancer. The viral infections include hepatitis, and acquired immunodeficiency syndrome (AIDS), and the immune disorders may be autoimmune disorders or transplant rejection. Cardiovascular diseases such as arterioscales may also be treated. The AGP-1 containing fusion proteins have increased biological activity compared to the soluble AGP-1 proteins used in prior art therapies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240
                                                                                     Twenty eight nucleic acids encoding PRO polypeptides which are useful for treating various tumors, e.g. breast cancer, and other inflammatory, angiogenic and immunological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  RVAAHITGTRGRSNTLSSPNSKNEKALGRKINSWESSRSGHSFLSNLHLRNGELVIHEKG 180
                                                                                                                                                        The present sequence is one of twenty eight novel PRO polypeptides. The PRO polypeptides and their agonists, including antibodies, peptides, and small molecule agonists, may be used to treat various tumours, e.g., cancers such as breast cancer, ovarian cancer, renal cancer, colorectal cancer, uterine cancer, prostate cancer, lung cancer, bladder cancer, central nervous system cancer, melanoma or leukaemia. They are also useful for treating other disorders such as neuronal, glial, astrocytal, hypothalamic and other glandlar, macrophagal, epithelial, stromal and blastocoelic disorders, and inflammatory, angiogenic and immunological
                                                                                                                                                                                                                                                                                                                                                         9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             181 FYYIYSQIYFREQEEIKENTKNDKQWVQYIYKYTSYPDPILLMKSARNSCWSKDAEYGLY 240
                                                                                                                                                                                                                                                                                                                                       The present invention relates to a formulation comprising Apo-2 ligand and divalent metal ions. Apo-2 ligand and the formulation are useful for tracting cancers and viral infections. Addition of divalent metal ions for making Apo-2 ligand and formulations containing Apo-2 ligand results in increased yield and stability of Apo-2 ligand trimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                          Use of divalent metal ions for making Apo-2 ligand and in formulations containing Apo-2 ligand for increasing yield and stability of ligand trimers, useful for therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, tumour necrosis factor, TNF, cytokine, cytostatic, virucide, TNF related apoptosis inducing ligand, TRAIL; cancer, viral infection; human immunodeficiency virus; HIV, leukaemia; gene therapy; lymphoma;

The invention relates to a cytokine designated as tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL), which induces apoptosis of certain target cells, including cancer cells and virally infected cells. The TRAIL polypeptides are useful in killing cancer cells, in treating viral infections (e.g. bovine viral diarrhoea or human melanoma), as a research reagent useful in studying apoptosis including the regulation of programmed cell death. TRAIL DNA sequences may be employed in developing a gene therapy approach to treating disorders mediated by defective or insufficient amounts of TRAIL, in the production of TRAIL polypeptides and as probes or primers in polymerase chain reactions (PCR). The present sequence is human TRAIL protein
                                                                                                                                                                                                                                                                                                                  New tumor necrosis factor related apoptosis inducing ligand polypeptides for treating viral infections (e.g. bovine viral diarrhea or human immunodeficiency virus), or cancers (e.g. leukemia or lymphoma).
                                                                                                                                                                                                                                                                                                                                                                                      Claim 2; Col 45-48; 41pp; English

The invention relates to a human tumour necrosis factor (TNF) related
receptor, TR6. TR6 can be expressed by standard recombinant methodology.
The TR6 polypeptides are useful for treating chronic and acute
inflammation, rheumatoid arthritis, septicemia, autoimmune diseases (e.g.
inflammation, rheumatoid arthritis, septicemia, autoimmune diseases (e.g.
inflammation, rheumatoid arthritis, septicemia, autoimmune diseases (e.g.
to inflammation, restenosis, brain injury, AIDS, bone diseases cancer,
atherosclerosis, and Alaheimer's disease. These may also be used to
inhibit production of TNF-alpha and eicosanoids, as research reagents and
materials for discovering treatments and diagnostics to animal and human
diseases. The polypeptides may further be used as immunogens to produce
antibodies immunospecific for the TR6 polypeptides. The polynucleotides
may also be used as hybridization probes for CDNA and genomic DNA, for
solating full-length cDNAs and genomic clones encoding TR6 and of other
genes having high sequence similarity to TR6 gene, and for chromosome
contains also known as TRALI (MFF-related apoptosis-inducing ligand) and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò

The invention relates to treating an individual at risk for or suffering from infection with a pathogenic or opportunistic organism. The method involves administering a combination of two to five agents comprising:

(a) dendritic cell mobilisation factor; (b) dendritic cell maturation agent; (c) dendritic cell activation agent; (d) T cell enhancing factor; or (e) activated, antigen-specific T cells. The methods are useful for treating an individual at risk for or suffering from infection with a pathogenic or opportunistic organism, e.g. viruess (e.g. HIV), bacteria (e.g. M. tuberculosis), yeast, fungi (e.g. C. albicans) or protozoa (e.g. T. cruzi, which causes Chaga's disease). The methods are sepecially useful for treating an individual suffering from immunosuppression by method is useful for treating inflammations, chickenpox, oral or genital herpes, mononucleosis, multifocal leukoencephalogathy, hepatitis, AIDS, T cell leukemia or I cell lymphoma. The activated antigen-presenting dendritic cells are useful as a vaccine adjuvant. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating an individual with tumors or cancers, e.g. liver cancer or brain tumor, by administering a combination of dendritic cell populations, \mathtt{T} cell enhancing factors and activated, antigen-specific \mathtt{T} cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    bearing subject. The method involves administering a combination of 2 to 5 agents comprising dendritic cell mobilisation factor, dendritic cell maturation agent, tumours filling agent, Tell enhancing factor or activated, antigen-specific Tells. The method is useful for treating tumours or cancers in a subject e.g. skin cancer, prostate cancer, liver cancer, tumours of the bone, brain or spinal cord, actinic keractosis, or cervical intraepithelia neoplasia. The present amino acid sequence represents the human TRAIL protein that was used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MAMMEVQGGPSLGQTCVLIVIFTVLLQSLCVAVTYVYFTNELKQMQDKYSKSGIACFLKE 60

This invention relates to a novel method for enhanced killing of tumour cells comprising contacting a tumour cell with a synergistic combination of a death domain receptor ligand and a diterpenoid triepoxide. This method has cytostatic activity and works by blocking TNF-alpha mediated induction of c-IAP2 and c-IAP1. The method of the invention may be used for treating tumours, particularly solid tumours, e.g. carcinoma, mammary adenocarcinoma and non-small cell lung carcinoma also neurological malignancies, e.g. non-Hodgkin's lymphoma, malignancies, non-Hodgkin's lymphoma, chronic lymphocytic leukaemia, malignant cutaneous T-cells, mycosis fungoides, non-MF cutaneous T-cell lymphoma, lymphomatoid papulosis, T-cell rich cutaneous lymphoid hyperplasia, bullous pemphigoid, discoid lupus erythematosus, lichen planus. The combination may be administered

                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                  9
with other active agents, e.g. anti-metastatic, anti-tumour or anti-angiogenic agents. The potent synersy between the diterpenoids and the death domain ligands allows increased killing at equivalent or lower doses, and can sensitise otherwise resistant cells. This sequence represents the human TNF related apoptosis inducing ligand (TRAIL) protein sequence. TRAIL is a death domain receptor used in the used method of the invention in combination with diterpenoid triepoxides to kill tumours by induction of apoptosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of CPT-11 which is a chemotherapeutic agent of the topoisomerase I inhibitor class, and Apo-2 ligand receptor agonist for enhancing apoptosis in mammalian cells, or for treating cancer in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /note= "Apo-21 polypeptide used in method of Claim 18"

The present sequence is that of human Apo-2 ligand (Apo-2L or TRAIL). The invention relates to methods of inducing apoptosis in mammalian cells, and especially to the topoisomerase I inhibitor class) to chemotherapeutic agent of the topoisomerase I inhibitor class) to synergistically induce apoptosis in mammalian cells, in particular mammalian cancer cells (claimed). The cells may be in cell culture or in a mammal, e.g. a mammal suffering from cancer or a condition in which induction of apoptosis in the cells is desirable. A claimed method of treating cancer in a mammal comprises administering CPT-11 and Apo-2L receptor agonist, where the CPT-11 is caministered about 6-72 hours prior to administration of the Apo-2L receptor agonist sequence) and anti-DRS coeptor agonist. Exposure of the cancer cells to CPT-11 and Apo-2L receptor agonist sequence) and anti-DRS of anti-DRS receptor attribodies. Exposure of the cancer cells to CPT-11 and Apo-2L receptor agonist leads to upregulation of DR4 and DR5 receptors, canti-DR5 receptor agonist leads to upregulation of DR4 and DR5 receptors.

Cativity, An example illustrates the synergistic inhibition of tumour controls and approach and activity and anti-DR5 corrections.

```
in present interior describes an escipiant coil strain () described in chromosomal degp and precesse Degp and Prc, respectively, and harbouring a mutant spr gene, the product of mutant spr gene suppresses grawth phenotypes exhibited by strains harbouring prc mutants.

(1) is useful for producing a polypeptide, by culturing (1) comprising nucleic acid encoding the polypeptide, which is heterologous to the strain, such that the uncleic acid is expressed, and recovering the heterologous polypeptide from the strain. The heterologous polypeptide from the strain. The heterologous polypeptide is proteolytically sensitive. Culturing of (1) is performed in a fermentor of proteolytically sensitive. Culturing of (1) is performed in a fermentor of proteolytically sensitive. Culturing of (1) is performed in a fermentor of proteolytically sensitive. Culturing of (1) is performed in a fermentor of proteolytically sensitive. Culturing of (1) is performed in a fermentor of polypeptide is an antibody (numanised or full-length estrain. The polypeptide is an antibody (numanised or full-length estrain. The polypeptide is an antibody is an anti-dody is an antibody. The antibody is also an antibody fragment having a light chain (kappa light chain). The antibody fragment having a light chain (kappa light chain). The antibody fragment having a light chain (kappa light chain). The antibody fragment staper fusion, anti-cissue factor Fab'2-leucine zipper fusion, anti-cissue factor Fab'2-leucine zipper fusion with a 6-histidine tag, anti-citsue capted fragment anti-vEGF Fab, with or without a histidine tag, and anti-citsue capper fusion with a 6-histidine tag, and anti-citsue inversents a human Apo-2 ligand amino acid sequence from the present
                                                                                                                                                                                                                              Novel Escherichia coli strain useful for producing polypeptide, deficient in degP and prc encoding protease, and harboring mutant spr gene, product of gene suppresses growth phenotypes of strains harboring prc mutants.

The present invention relates to a method of producing a population of activated, Cryptococcus neoformans antigen-presenting dendritic cells, comprising causing the obtained dendritic cells to present the antigen and maturing the dendritic cells. The activated, C. neoformans antigen-expressing dendritic cells are useful for treating, or as vaccines or vaccine adjuvants against, C. neoformans infection, or for generating antigen-specific T cells, The present sequence is a human protein shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                      Producing a population of activated, Cryptococcus neoformans antigen-
presenting dendritic cells for preventing or treating C. neoformans
infection comprises causing the obtained dendritic cells to present the
                                   C neoformans antigen expressing dendritic cell related protein #4.
                                                                    Human, fungicide, fungal infection, dendritic cell; antigen;
Cryptococcus neoformans; vaccine, immunostimulant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 29-30; 32pp; English.

Certural culterentiation and acvelopment of multicellular organisms.

Apoptosis is induced by certain cytokines which include TNF and TRAIL

(also referred to as Apo-2 ligand, Apo-2L). TRAIL is a type II membrane

containing receptors, DR4 and DR5, as well as two decoy receptors, DR1

containing receptors, DR4 and DR5, as well as two decoy receptors, DR1

containing receptors, DR4 and DR5, as well as two decoy receptors, DR1

containing receptors, Interferons, induces apoptosis in tumour cells, whereas

normal cells are relatively resistant without showing significant toxic

side effects. Thus, TRAIL has the potential to be a very useful

antitumour agent. The naturally occurring sphice variants may differ in

their cellular distribution, expression levels/timing and activity.

Conternining these factors could provide possible mechanisms for the

induction of apoptosis of tumours cells. The splice variant polypeptides

and polynucleotides can be used in gene therapy, to raise antibodies, to

cheeceft the levels, distribution and ratios of expression of TRAIL, and

its splice variants, in a biological sample and to identify compounds

which bind the variant TRAIL products and modulate its activity (agonists

conduction of apoptosis of the amino acid sequences, are useful for causing a

cytotoxic effect in cancer cells and for treatment of diseases which can

control and or prevented by lowering or raising the level of

the amilorated, cured or prevented by lowering or raising the level of

the amilorated, cured or prevented by lowering or raising the level of

the amilo acid sequences. The antibodies may also have a therapeutic

cutility in blocking or decreasing the activity of the TRAIL variant

products. Diseases that may be treated include cancer, neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention discloses isolated, naturally occurring, polypeptide splice variants of human tumour necrosis factor (TNF) related apoptosis inducing ligand (TRALL). Apoptosis, or programmed cell death, occurs during normal cellular differentiation and development of multicellular organisms.

The invention relates to an Apo-3 polypeptide having an extracellular domain (ECD) sequence and a death domain sequence. The Apo-3 polypeptide domain (ECD) sequence and a death domain sequence. The Apo-3 polypeptide cateriority in mammalian cells. Human Apo-3 exhibits similarities to the tumour necrosis factor receptor (TNFR) family of polypeptides. The invention also relates to a chimeric molecule comprising an extracellular domain sequence comprising residues 1-198 of Apo-3 fused to a heterologous mainto acid sequence. The Apo-3 polypeptide is useful therapeutically to induce apoptosis in ammalian cells. Decreased levels of apoptosis has been associated with conditions such as cancer, hugus, and herpes virus infection. Increased levels of apoptosis are associated with diseases such as acquired levels of apoptosis are associated with diseases such as acquired clasease, amyorrophic lateral associated with disease, parkinson's classase, amyorrophic lateral as clerosis, multiple sclerosis, retinitis pigmentosa, cerebellar degeneration, aplastic anaemia, myocardial infarction, stroke, reperfusion injury, and toxin-induced liver disease. The Apo-3 polypeptide is also useful in non-therapeutic applications such as in quantitative diagnostic assays a control against which samples containing unknown quantities of Apo-3 may be prepared, in generating anti-bodies, as standards in assays for Apo-3 in affinity purification techniques, and in competitive-type receptor binding assays. The chimeric molecule is useful therapeutically to inhibit apoptosis or nuclear factor Apo-3 antibodies. The present sequence represents polypeptide sequence of the human Apo-2 ligand protein which is also reported to be involved in apoptotic cell death. In the current invention the apoptocit of the Apo-2 ligand protein was measured on human lymphoid cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                181 FYYIYSQTYFRFQEEIKENTKNDKQMVQYIYKYTSYPDPILLMKSARNSCWSKDAEYGLY 240

apoptosis, or as immunogens used in control and interests the antibodies. The antibodies may be used to block excessive apoptosis, for instance in neurodegenerative disease, or to block potential autoimmune/ inflammatory effects of Apo-3 resulting from NF-kappaB activation. The nucleic acid sequences are useful as diagnostics for tissue-specific typing, for preparing Apo-3 polypeptides, or for generating transgenic or knockout animals are useful in developing and screening of therapeutically useful reagents. The present sequence represents the amino acid sequence of human Apo-2 ligand
                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated Apo-3 polypeptide. The Apo-3 polypeptides are useful for stimulating or inducing apoptotic activity in mammalian cells e.g. cancer cells, or for in vivo or ex vivo gene therapy techniques. The Apo-3 chimeric molecules are useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DDSYMDPNDEESMNSPCWQVKWQLRQLVRKMILRTSEETISTVQEKQQNISPLVRERGPQ 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

Henzel W, Kabakoff RC; Gurney AL, Hebert C, Watanabe CK, Wood WI; Novel isolated PRO polypeptides e.g. PRO240, PRO381, PRO540, useful for treating tumor, preferably cancer, or for treating neuronal, glial, hypothalamic, stromal, inflammatory, angiogenic and immunologic

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. PRO polypeptide lacking its associated signal peptide or PRO polypeptide extracellular domain with or without its associated signal peptide. The PRO polypeptide or an antibody binding to it is useful for inhibiting the growth of a tumor cell. A composition containing a PRO polypeptide is useful for inhibiting neoplastic cell growth or for treating a tumour, preferably cancer (such as liver, breast, ovarian, renal, colorectal, uterine, prostate, lung, cancer, hepatic carcinomas, sarcomas, glioblastomas, melanoma or leukaemia) in a mammal. The PRO polypeptide is useful for identifying its gonists. The PRO polypeptide or an antibody binding to it is useful in the preparation of a medicament for treating a condition which is composite to the PRO polypeptide or an antibody binding to it. The PRO POLYPEPTION of the preparation of a medicament for treating a condition which is constituted or an antibody binding to it. The PRO POLYPEPTION of it is also useful for treating a condition and a medicament for treating a condition which is constituted or an antibody binding to it. The PRO POLYPEPTION of the preparation of a medicament for treating a condition which is contained to the preparation of a medicament for treating a condition and the properties or an antibody binding to it. The PRO POLYPEPTION of the preparation of a medicament for treating and the preparating the properties or an antibody binding to it. The PRO PRO POLYPEPTION of the preparation of a medicament for treating and the preparation of a medicament for treating and the preparation of a medicament for treating and the preparation of a medicament for treating and the preparation of a medicament for treating and the preparating the preparation of a medicament for treating and the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the preparation of the p neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelle, inflammatory, angiogenic and immunologic disorders. The present sequence represents the amino acid sequence of a PRO polypeptide of the invention

The invention discloses a method for examining allergic diseases, which comprises measuring the expression level of tumour necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) gene in a specimen from the patient and comparing this level with the level in healthy persons. TRAIL gene expression is decreased in patients. The nucleic acids and polypeptide can be used to screen for agents for the treatment of allergic diseases, possibly using a transgenic rodent as a model animal for the disease, with effectiveness determined by changes in expression levels or protein activity. The method is useful for the diagnosis, examination, prevention and treatment of allergic diseases, including atopic skin inflammation. The sequence presented is the human TRAIL

The invention relates to antibodies that immunospecifically bind to tumour necrosis factor (TMF)-related apoptosis-inducing ligand (TRAIL) receptors (TRMIL-R). Antibodies of the invention are useful for treating, preventing or antellorating cancer (e.g. cancers of pancreas, uterine, breast, colon, lung and gastrointestine and Kaposi's sarcoma) and other hyperproliferative disorders, neurodegenerative disorders (e.g. parkinson's disease, Alzheimer's disease and Huntington's disease), parkinson's disease, Alzheimer's Hashimoto's disease and immunodeficiency syndrome, inflammatory disorders (e.g. asthma, allergic disorders and relumnodeficiency syndrome), inflammatory disorders (e.g. asthma, allergic disorders and relumnode infections), myelodysplastic syndromes (e.g. aplastic anaemia') graft-versus-host disease, ischeemic injury, liver injury, toxin-induced liver disease, septic shock, cachexia, anorexia and proliferative disorders. Antibodies of the invention are also useful for treating cardiovascular disorders, cachexia, anorexia and proliferative disorders. Collabetes, coular disorders disorders, thromboric microangiopathies, and ulcerative collits and for wound healing. The invention is also used in the prepare vaccines. The present sequence is human TRAIL protein also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The invention relates to an antibody that specifically binds: (a) the human tumor necrosis factor (TNF) related apoptosis inducing ligand (TRAIL) protein appearing as ABU08558, (b) a soluble human TRAIL protein appearing a polypeptide; (C) a polypeptide Comprising amino acids 124-276 of ABU08558, or (d) a fragment of the TRAIL protein. Also included is an antigen-binding fragment of the antibody (a monoclonal antibody), a hybridoma cell line that produces the antibody The antibody); sused in assays to detect the presence of TRAIL polypeptides, either in vitro or in vivo, purifying TRAIL by affinity chromatography, blocking binding of TRAIL, or target cells and thus inhibiting a biological activity of TRAIL. The antibody is useful for treating disorders mediated or exacerbated by TRAIL, e.g. thrombotic microangiopathies, e.g. thrombotic transmort (TRAIL, e.g. thrombotic microangiopathies, e.g. thrombotic (TRAIL, e.g. thrombotic microangiopathies, e.g. thrombotic (Even though it can strike children as well) small blood vessel clotting disorders e.g., cardiac problems in paediatric AIDS patients and systemic uppus erythematosus (SLE). The present sequence represents human TRAIL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
